

APPARATUS FOR HOLDING GARMENT HANGERSABSTRACT OF THE DISCLOSURE

A garment hanger holder device has a hook with a rectangular slot to receive a strap formed into a loop. The hook member can have multiple slots, through which a strap can be threaded to provide a simple strap adjustment mechanism. The strap can have multiple loops that can be adjustable or fixed in size. An opening of the hook member is sized and shaped to be about equal to a diameter of a standard size garment hanging rod. The opening size and shape creates resistance with the hook is placed on or removed from a garment hanging rod. The holding device permits multiple garment hangers to be suspended from a single hook and contribute to ease of storage, transportation and display. The resistance provided by the sized and shaped hook opening prevents the device from being jostled off of a garment hanging rod.
